# *Security in the World of IoT*

---

## **Outline**

- Knowledge for IoT Security
- IoT Devices
  - Identifying Buses and Interfaces
  - Firmware Reverse Engineering
  - Countermeasures Against Static Analysis
- IoT Services
  - API Security Basics
  - Edge Security
  - Service to Service Communication
  - Message Queuing Telemetry Transport (MQTT)

# Knowledge for IoT Security

OWASP IoT Top 10 - 2018
I01:2018 - Weak Guessable, or Hardcoded Passwords
I02:2018 - Insecure Network Services
I03:2018 - Insecure Ecosystem Interfaces
I04:2018 - Lack of Secure Update Mechanism
I05:2018 - Use of Insecure or Outdated Components
I06:2018 - Insufficient Privacy Protection
I07:2018 - Insecure Data Transfer and Storage
I08:2018 - Lack of Device Management
I09:2018 - Insecure Default Settings
I10:2018 - Lack of Physical Hardening

# *Knowledge for IoT Security*

---

## **OWASP IoT Top 10 – 2018**

- **I01:2018 - Weak, Guessable, or Hardcoded Passwords**

Use of easily brute forced, publicly available, or unchangeable credentials, including backdoors in firmware or client software that grants unauthorized access to deployed systems.

- **I02:2018 - Insecure Network Services**

Unneeded or insecure network services running on the device itself, especially those exposed to the internet, that compromise the confidentiality, integrity/authenticity, or availability of information or allow unauthorized remote control.

# *Knowledge for IoT Security*

---

## **OWASP IoT Top 10 – 2018**

- **I03:2018 - Insecure Ecosystem Interfaces**

Insecure web, backend API, cloud, or mobile interfaces in the ecosystem outside of the device that allows compromise of the device or its related components. Common issues include a lack of authentication/authorization, lacking or weak encryption, and a lack of input and output filtering.

- **I04:2018 - Lack of Secure Update Mechanism**

Lack of ability to securely update the device. This includes lack of firmware validation on device, lack of secure delivery (un-encrypted in transit), lack of anti-rollback mechanisms, and lack of notifications of security changes due to updates.

# *Knowledge for IoT Security*

---

## **OWASP IoT Top 10 – 2018**

- **I05:2018 - Use of Insecure or Outdated Components**

Use of deprecated or insecure software components/libraries that could allow the device to be compromised. This includes insecure customization of operating system platforms, and the use of third-party software or hardware components from a compromised supply chain.

- **I06:2018 - Insufficient Privacy Protection**

User's personal information stored on the device or in the ecosystem that is used insecurely, improperly, or without permission.

# *Knowledge for IoT Security*

---

## **OWASP IoT Top 10 – 2018**

- **I07:2018 - Insecure Data Transfer and Storage**

Lack of encryption or access control of sensitive data anywhere within the ecosystem, including at rest, in transit, or during processing.

- **I08:2018 - Lack of Device Management**

Lack of security support on devices deployed in production, including asset management, update management, secure decommissioning, systems monitoring, and response capabilities.

# *Knowledge for IoT Security*

---

## **OWASP IoT Top 10 – 2018**

- **I09:2018 - Insecure Default Settings**

Devices or systems shipped with insecure default settings or lack the ability to make the system more secure by restricting operators from modifying configurations.

- **I10:2018 Lack of Physical Hardening**

Lack of physical hardening measures, allowing potential attackers to gain sensitive information that can help in a future remote attack or take local control of the device.

# *IoT Devices*

---

## Identifying Buses and Interfaces

- **Universal Asynchronous Receiver Transmitter (UART)**  
Debug logs from device bootup, terminal
- **Serial Peripheral Interface (SPI) and Inter-Integrated Circuit (I2C)**  
Data communications between different components (EEPROM, RTCs) in an embedded device circuit.
- **Joint Test Action Group (JTAG)**  
Read/write data, debug running processes, modify program execution flow.

# IoT Devices

## Firmware Reverse Engineering

Firmware is a piece of code residing on the nonvolatile section of the device. It consists of various components such as **kernel**, **bootloader**, **file system**, and additional resources.

```
$ binwalk -e IoTGoat-x86.img
```

DECIMAL	HEXADECIMAL	DESCRIPTION
262144	0x40000	Linux EXT filesystem, blocks count: 4096, image size: 4194304, rev 2.0, ext2 filesystem data, UUID=57f8f4bc-abf4-655f-bf67-946fc0f9c0f9
5325930	0x51446A	xz compressed data
17301504	0x1080000	Squashfs filesystem, little endian, version 4.0, compression:xz, size: 3481630 bytes, 1352 inodes, blocksize: 262144 bytes, created: 2019-01-30 12:21:02

## Countermeasures Against Static Analysis

As developers, we can do a lot to complicate reverse engineering:

- **Do not store secrets** (passwords or cryptographic keys) in the code.
- **Do not deliver debug information** (without compiler flag `-g`) with your binary file.
- **Use compiler optimizations** (compiler flag `-O2`) to make generated code more compact and difficult to read.
- Use the tool **strip** to also remove symbolic constants.

# *IoT Services*

---

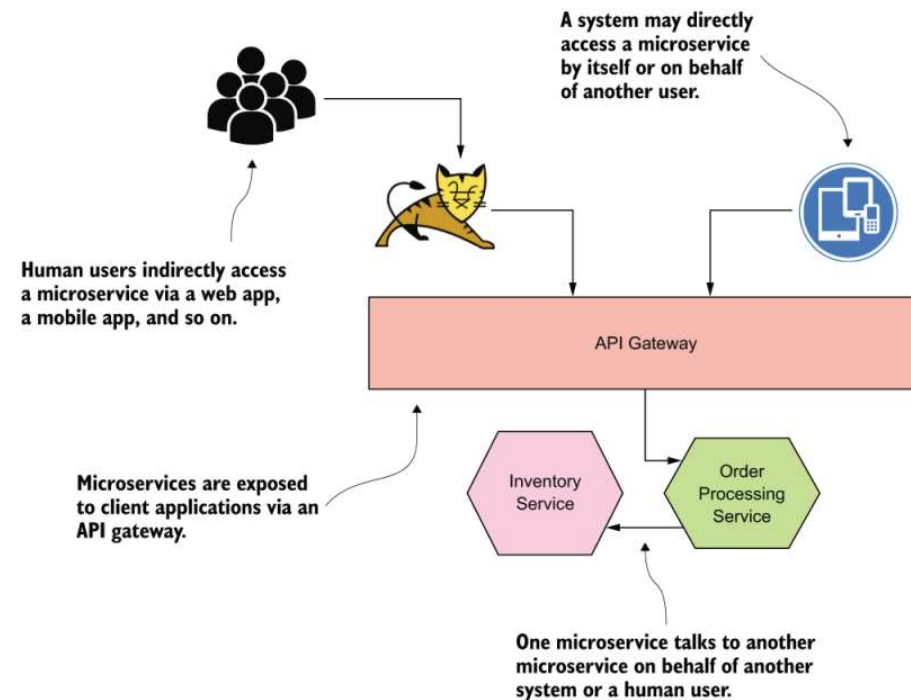

## **API Security Basics**

- **Transport Layer Security (TLS)**
- **Authentication**  
Verifying who someone is.
- **Authorization:**  
Verifying what specific applications, files, and data a user has access to.  
Service-, Function-, and Object-Level.
- **API Specifications**  
Open API (versioning, operations, responses, data constraints)

# IoT Services

## Edge Security

- **API Gateway**  
Routing, Request Filtering
- **Access Control**  
OAuth 2.0
- **Throttling, Monitoring**

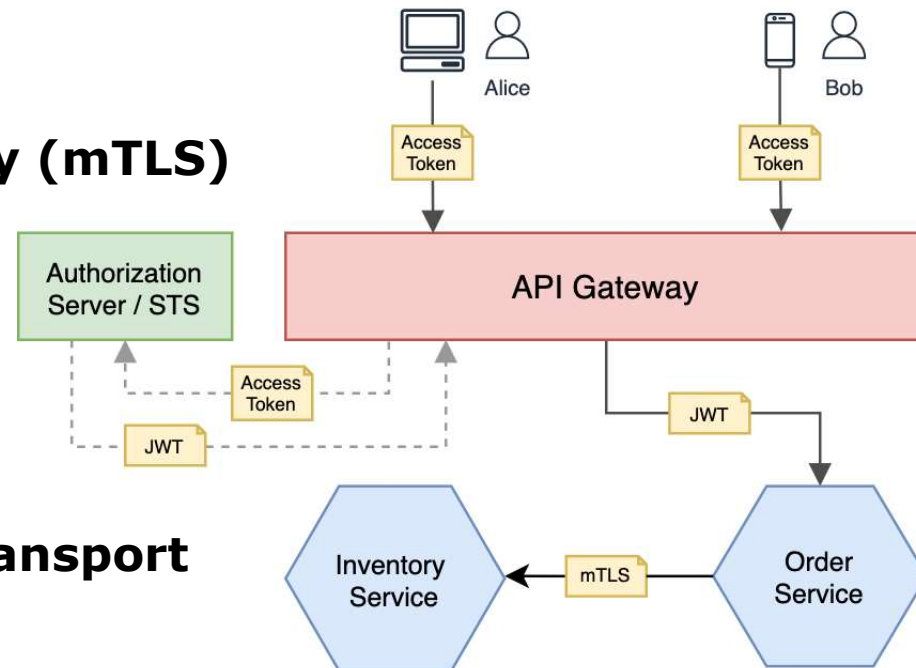

(Sirwardena, 2020)

# IoT Services

## Service to Service Communication

- **Mutual Transport Layer Security (mTLS)**  
Certificate management
- **JSON Web Token (JWT)**
- **Message Queuing Telemetry Transport (MQTT) over TLS**  
(publish/subscribe, client/broker)

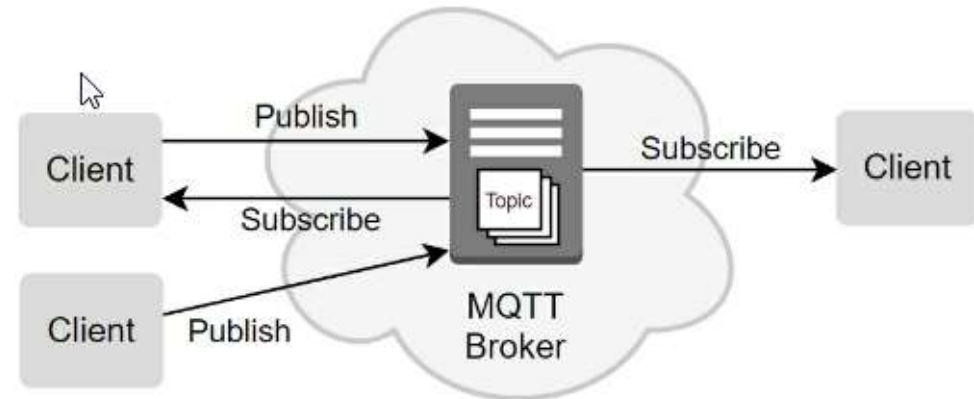

(Sirwardena, 2020)

# *IoT Services*

## Message Queuing Telemetry Transport (MQTT)

MQTT is a broker-based **publishing and subscription messaging protocol**.

MQTT uses **Transport Layer Security (TLS)** encryption with username, password protected connections.

(Smart, 2020)
